

# Converse Consultants

Over 50 Years of Dedication in Geotechnical Engineering and Environmental Sciences

October 20, 2005

Alcat & Brown Inc.  
800 West Fourth Street  
Williamsport, Pennsylvania 17701

Attention: Mr. William C. Brown

Subject: Phase II Environmental Site Assessment  
Williamsport Landfill  
Rose Street  
Williamsport, Pennsylvania  
(Converse Project No. 05-17746-01)

RECEIVED  
OC 28 2005  
ENV CLEAN UP

Dear Ladies and Gentlemen:

Converse Consultants (Converse) is pleased to submit this Phase II Environmental Site Assessment (ESA) Report for the Williamsport Landfill, Williamsport, Pennsylvania (Facility). The Facility is an inactive landfill on an approximately 10-acre tract of land. Appendix A: Figure 1 presents the location of the Facility relative to area roads and features. The Phase II ESA was conducted to evaluate soil and groundwater quality beneath the Facility. Constituent concentrations in soil and groundwater were compared to the residential medium specific concentrations (RMSC) Statewide Health Standard that is promulgated in *Act 2 of 1995: Pennsylvania Land Recycling and Environmental Remediation Standards Act* (Act 2) and as administered by 25 Code Chapter 250 (§250): *Administration of the Land Recycling Program*.

## SITE HISTORY

Converse was provided with and reviewed the following documents:

1. *R-585-2-8-51, Site Inspection of Williamsport Landfill, Prepared Under TDD No. F3-8710-02, EPA No. PA-1106, Contract No. 68-01-7346, For the Hazardous Site Control Division U.S. Environmental Protection Agency*, dated September 20, 1988 (*1988 Site Inspection Report*) prepared by NUS Corporation Superfund Division.
2. *Report on Geotechnical Engineering Investigation for Proposed Property Development, Rose Street and Contrail Railroad, Williamsport, Pennsylvania*, dated July 1991 (*1991 Geotechnical Investigation Report*) prepared by F.T. Kettlinski & Associates, Inc.

The documents indicated that the landfill operations were conducted from 1960 to 1978. Groundwater is at depths that range from 19 feet to 31 feet below grade and the depth to bedrock is approximately 60 feet below grade. Sanitary landfill materials are

present from near-grade to an average depth of 30 feet below grade. Landfill material thicknesses range from 25 feet to 36 feet and the landfill materials are underlain by unconsolidated alluvial materials that range from sandy silt to silty sand and gravel.

The documents indicate that waste oils were used for dust control and the wastes that were reportedly disposed at the site include:

- a. Incineration residue.
- b. Commercial waste
- c. Construction and demolition waste.
- d. Industrial waste.
- e. Park and beach waste.
- f. Patient care institution waste.
- g. Septic tank waste.
- h. Street and alley waste.
- i. Tree and landscaping waste.
- j. Hazardous waste (paint thinner, organic chemicals, and pathological and biological wastes).

Soil and surface water tests that were conducted as part of the 1988 Site Inspection identified trace to low levels of organic and inorganic contaminants. The *1988 Site Inspection Report* concluded that "based upon the limited sampling survey, there does not appear to be a hazard to human health, although the present status of groundwater beneath the site cannot be ascertained".

## **PHASE II ESA SCOPE-OF-WORK**

### **General**

The Phase-II ESA scope-of-work included the following primary tasks:

1. Compilation of a site Health and Safety Plan.
2. Boring Location Selection and Marking.
3. Installation of six (6) groundwater monitoring wells in the landfill materials and unconsolidated deposits.
4. Completion of a limited evaluation of soil quality that consisted of the completion of seventeen (17) soil borings to 8 feet below grade, and the submission of six (6) samples for laboratory analysis.
5. Completion of a relative elevation survey of the monitoring wells.

6. Completion of one (1) groundwater sample collection event (GSCE) from the monitoring wells.

### **Health And Safety Plan**

A site specific Health & Safety Plan that complies with Occupational Safety and Health Administration (OSHA) 29 CFR Part 1910.120 was developed and implemented for the field activities at the Facility.

### **Monitoring Well and Boring Location Selection And Marking**

Monitoring well locations were selected to assess groundwater quality at the property boundary that was presumed to be upgradient with respect to the direction of groundwater flow (hydrogeologically upgradient), within the property boundary of the Facility, and at the hydrogeologically downgradient property boundary. It was assumed that the direction of groundwater flow in the water table aquifer beneath the Facility was to the south-southeast, towards the Susquehanna River. Appendix A: Figure 2 presents the monitoring well locations.

The soil boring locations were selected by systematic random methods. The PADEP Microsoft Excel spreadsheet "SystRandSamp3Dnn.xls" was used to identify the soil boring locations. This spreadsheet was created by the PADEP to calculate systematic random sample locations. The spreadsheet was used to identify sample locations prior to field activities based on the estimated dimensions of the Facility. Appendix A: Figure 3 presents the soil boring locations.

### **Monitoring Well Installation**

Prior to the initiation of drilling activities, a decontamination pad was constructed at the Facility of two (2) layers of 6-millimeter, polyethylene sheets and an appropriate material to create a berm. A high temperature-high pressure wash was used to decontaminate the drilling and sample collection equipment prior to the initiation of drilling activities and between the boring locations. Soil cuttings and the polyethylene sheets waste were containerized and staged at the Facility pending waste characterization and appropriate disposition.

The monitoring wells were completed to depths ranging from 38.3 feet below grade to 42.8 feet below grade using hollow-stem auger drilling methods. Appendix B: Table 1 presents the monitoring well completion depths and screened intervals. Soil samples were collected from 2-foot intervals every 5 feet using 2-foot long by 2-inch diameter split-barrel samplers similar to the requirements that are described in the *ASTM Standard D 1586-92*. A portion of each soil sample was field-screened utilizing a flame ionization detector (FID) along with visual inspection, and was characterized similar to the requirements that are described in the *ASTM Standard D 2488-93*. Drill cuttings were containerized and staged at the Facility.

The wells were constructed similar to the requirements that are described in the *Pennsylvania Groundwater Monitoring Guidance Manual, December 1, 2001 (2001 GM Guidance Manual)* and *ASTM Standard D 5092-90*. The wells were screened with 2.0-inch diameter, Schedule 40, 0.010-inch factory slotted, flush threaded, PVC screen. The borehole above the screened interval was cased with 2.0-inch diameter, Schedule 40, flush threaded PVC riser. The annular space between the borehole and the well screen was filled with Jessie Morie 00 sand or equivalent to approximately one (1) foot above the screened interval. The annular space above the sand was filled with a bentonite grout. The monitoring wells were secured with an expandable locking cap and padlock and completed with above-grade protective well casings. Appendix B: Table 1 presents a summary of well construction. Appendix B: Table 1 presents a summary of the monitoring well construction. Appendix D presents the monitoring well completion diagrams and the geologic logs.

The monitoring wells were developed using a submersible pump and dedicated polyethylene tubing to remove fine-grained material and to initiate hydraulic communication with the aquifer. The development water was treated using an Aqua 50 Adsorber GAC canister (55 pounds of granulated activated carbon) and discharged to the ground surface.

### **Relative Elevation Survey**

Larson Design Group of Williamsport, Pennsylvania, a Pennsylvania licensed surveyor, completed the survey to provide the data necessary to assess the direction of groundwater flow in the water table aquifer in the area of the Facility. The survey provided elevations of the top of casing and a reliable horizontal location of each well. The TOC elevations and the measured groundwater levels in each well were then used to calculate groundwater elevations at each data point. Appendix B: Table 1 presents a tabulated summary of the elevation survey data, depth to water data, and calculated groundwater relative elevation data.

### **Groundwater Sample Collection**

#### **General**

One (1) groundwater sample collection event was conducted on August 24, 2005. The groundwater sample collection event was conducted approximately two (2) weeks after the monitoring wells were developed to allow the wells to stabilize and equilibrate to subsurface conditions.

Prior to sample collection, groundwater levels were measured at all six (6) monitoring wells and the saturated casing volumes were calculated. The wells were purged of approximately three (3) saturated casing volumes prior to sample collection using a submersible pump and dedicated polyethylene tubing. The temperature, specific

conductivity, DO, ORP, and pH of the purge water were periodically measured and recorded during purge activities. The purge water was treated using an Aqua 50 Adsorber GAC canister (55 pounds of granulated activated carbon) and discharged to the ground surface.

Groundwater samples were collected using single-use, disposable, polyethylene bailers, and transferred directly into laboratory-supplied glassware.

### Laboratory Analysis

The groundwater samples and the field blank were analyzed for volatile organic compounds (VOCs: USEPA Method 8260), semi-volatile organic compounds (SVOCs: USEPA Method 8270), PCBs (USEPA Method 8082), pesticides (USEPA Method 8081A), and priority pollutant metals (PP metals: USEPA Method 6010A). The trip blank was analyzed for VOCs (USEPA Method 8260).

### Soil Boring

#### General

Seventeen (17) soil borings were completed using a truck-mounted, GeoProbe<sup>R</sup> sample collection system. Soil samples were collected continuously from grade to the terminal depth of the boring (approximately 8 feet below grade) using 2-inch diameter by 4-feet long, acetate liners (*ASTM Standard D 6282-98*). Each 2-foot interval was considered a discrete soil sample. A portion of each soil sample was field-screened utilizing a photoionization detector (PID) and a flame ionization dedector (PID), along with visual inspection, and were characterized similar to the requirements that are described in the *ASTM Standard D 2488-93*. Appendix E presents the soil boring geologic logs.

Soil samples that were submitted for volatile organic compound (VOCs) laboratory analysis were transferred into laboratory-supplied glassware in accordance with *USEPA Method SW846-5035* (volatile fraction: syringe and preservative method). Soil samples that were submitted for semi VOCs (SVOCs), PCB, pesticide, and inorganic analysis were transferred to laboratory supplied glassware using single-use polyethylene scoops. These samples were not the portion of the soil sample that is used for field screening purposes.

### Laboratory Analysis

One (1) soil sample from each soil boring that was representative of "worst case" conditions at each borehole as indicated by field screening was collected in laboratory supplied glassware as described in the preceding section. Six (6) (soil samples SB-2.4, SB-6.4, SB-8.4, SB-10.2, SB-12.3 and SB-16.3) of the seventeen (17) soil samples were selected for laboratory analysis. These samples were selected as representative of "worst case" conditions at the Facility boring locations. These samples had high field

screening instrument responses and were aerially distributed to provide data throughout the Facility. Converse archived the remaining soil samples pending the initial results. Appendix A: Figure 4 presents the location of the boreholes from which samples were selected for laboratory analysis.

The soil samples and the field blank were analyzed for volatile organic compounds (VOCs: USEPA Method 8260), semi-volatile organic compounds (SVOCs: USEPA Method 8270), PCBs (USEPA Method 8082), pesticides (USEPA Method 8081A), and priority pollutant metals (PP metals: USEPA Method 6010A). The trip blank was analyzed for VOCs (USEPA Method 8260)

### **Quality Assurance/quality Control Measures**

Field and laboratory QA/QC protocol was consistent with those that are published in the United States Environmental Protection Agency (USEPA) document titled *Solid Waste, Test Methods for Evaluating Solid Waste (EPA Manual SW-846)*. One (1) field blank and one (1) trip blank were submitted with the sample set analyzed to provide quality assurance.

## **RESULTS**

### **Landfill Material Distribution**

Landfill debris was encountered in all the soil borings. Debris was generally encountered at depths ranging from 2 to 4 feet below ground surface (bgs) and extended to the terminal depth of the boring at 8 feet bgs. The depth of landfill debris below the ground surface that was estimated from the monitoring well borings is as follows:

- MW-1: 21 feet
- MW-2: A minimum of 38.3 feet (total depth of boring)
- MW-3: 36 feet
- MW-4: 36 feet
- MW-5: 31 feet
- MW-6: 31 feet

The geology below the landfill debris primarily consisted of alluvial sand and gravel.

### **Groundwater Flow Direction**

Groundwater level measurements were collected on August 24, 2005 during the groundwater sampling event. Depths to groundwater ranged from approximately 19.8 feet bgs at monitoring well MW-1 to 29.56 feet bgs at Monitoring well MW-4. Appendix A: Figure 5 depicts the calculated groundwater elevation contours and the interpreted

groundwater contours. Appendix B: Table 1 presents a tabulated summary of the elevation survey data, depth to water data, and calculated groundwater elevation data.

As presented in Appendix A: Figure 5, groundwater elevation data indicate that the direction of groundwater flow in the water table aquifer beneath the Facility was to the southeast towards the Susquehanna River. Data also indicate that there was a groundwater depression in the southeastern portion of the Facility as indicated by the groundwater relative elevations at monitoring wells MW-2 and MW-5.

### **Soil Sample Results**

All soil samples were collected from the soil not in the zone of groundwater saturation (unsaturated soil). As required in §250.305(c), the lowest of the Ingestion Numeric Value, Inhalation Numeric Value, or the Soil to Groundwater Numeric Value (SGNV) was selected as the Medium-Specific Concentration Statewide Health Standard (MSC SHS) for each compound or analyte. When the SGNV was the lowest of the promulgated values, the greater of the following promulgated SGNVs was used as the Residential Medium Specific Concentration (RMSC); 1) 100 times the groundwater MSC (100XGMSC) or 2) Generic Value (GVMSC), as stipulated in §250.308(a)(1), (2), and (4).

Laboratory results indicate that constituent concentrations were identified above the RMSC SHS values in four (4) of the six (6) soil samples that were submitted for laboratory analyses. These samples and constituents are as follows:

- Soil sample SB-2.4: bis(2-ethylhexyl)phthalate (14.7 milligrams per kilogram [mg/kg]), chrysene (0.544 mg/kg), and indeno(1,2,3-cd) pyrene (0.752 mg/kg).
- Soil sample SB-8.4: antimony (47.7 mg/kg), lead (13,700 mg/kg), bis (2-ethylhexyl) phthalate (3.57 mg/kg), chrysene (0.457 mg/kg), and indeno (1,2,3-cd) pyrene (0.8 mg/kg).
- Soil sample SB-10.2: indeno(1,2,3-cd) pyrene (0.668 mg/kg).
- Soil sample SB-16.3: benzo(a)anthracene (20.7 mg/kg), benzo(a)fluoranthene (12.9 mg/kg), chrysene (18.6 mg/kg), indeno (1,2,3-cd) pyrene (6.12 mg/kg), and naphthalene (129 mg/kg).

Numerous other compounds and analytes were identified at concentrations equal to or greater than the respective Laboratory Quantitation Limit (LQL). The LQLs are less than the respective RMSC SHSs. Appendix B: Table 2 summarizes the detected compounds with respect to regulatory levels. Appendix C presents the laboratory reports. No analyte or compound was detected in the trip blank or the field blank.

### **Groundwater Sample Results**

As promulgated in §250.304(b), the constituent concentrations in groundwater were compared to the RMSC SHSs for used aquifers that are published in §250 Appendix A, Tables 1 and 2.

Laboratory results indicate that constituent concentrations were identified above the RMSC SHS values in all six (6) groundwater samples that were submitted for laboratory analyses. These samples and constituents are as follows:

- MW-1: Lead (258 ug/L).
- MW-2: Chromium (total) (134 ug/L) and lead (429 ug/L).
- MW-3: Antimony (22.4 ug/L), arsenic (59.9 ug/L), beryllium (7.01 ug/L), chromium (total) (162 ug/L), lead (552 ug/L), nickel (246 ug/L), selenium (50.4 ug/L), thallium (34.5 ug/L), and chlorobenzene (2,380 ug/L).
- MW-4: Antimony (14.9 ug/L) and lead (1,120 ug/L).
- MW-5: Arsenic (77.7 ug/L), beryllium (7.53 ug/L), chromium (total) (120 ug/L), lead (354 ug/L), nickel (137 ug/L), thallium (30.8 ug/L), and methyl tert-butyl-ether (MTBE) (22.8 ug/L).
- MW-6: Antimony (11.9 ug/L), arsenic (77.6 ug/L), beryllium (6.65 ug/L), chromium (total) (146 ug/L), lead (531 ug/L), mercury (279 ug/L), nickel (223 ug/L), and thallium (20.5 ug/L).

Numerous other compound and analytes were identified at concentrations equal to or greater than the LQL. The LQLs are less than the respective RMSC SHSs. Appendix B: Table 3 summarizes the detected compounds with respect to regulatory levels. Appendix C presents the laboratory reports.

No compound was detected in the trip blank. Thallium was detected in the field blank at a concentration greater than the NRMSC SHS. This can possibly be attributed to sample contamination from airborne dust.

### **Practical Quantitation Limits**

§250.4 stipulates limits that are related to practical quantitation limits (PQLs) for soil and groundwater. The *Pennsylvania's Land Recycling Program, Technical Guidance Manual*, (253-0300-100), May 4, 2002 (2002 LRP TGM): Tables IV-10 and IV-11 present PQLs that are established for a number of constituents. The PQLs that are listed in the 2002 LRP TGM are either the estimated quantitation limits (EQLs) that are established in the most current version of the USEPA RCRA Manual SW-846: *Test Methods for Evaluating Solid Wastes, Physical/Chemical Methods* (EPA RCRA

*Manual SW-846*) or the method detection limits (MDL) of the test methods that are cited in Table IV-10.

The LQLs are less than the PQLs.

### **Soil Gas**

Soil gas screening was conducted at the Facility during monitoring well installation activities. A Foxboro model OVA-128 organic vapor analyzer was used to screen for organic vapors and landfill gas in the boreholes during monitoring well installation activities. OVA readings were taken with and without an activated carbon filter. The charcoal filter was used to remove most organic vapors except for methane that is not readily removed by activated carbon. Because the OVA is calibrated to methane, a comparison of the readings provides an estimate of the amount of methane in the organic vapor in parts per million (ppm). Field screening data indicate that subsurface methane levels are greater than 1000 ppm which is the maximum concentration that can be measured by the OVA.

### **CONCLUSIONS**

Field activities and laboratory analysis indicate that the:

1. Organic and inorganic constituent concentrations are greater than the RMSC SHS in both unsaturated landfill material and groundwater.
2. Groundwater data indicate that impacted groundwater may extend beyond the property boundary (Point of Compliance (POC)) of the Facility.
3. The landfill refuse material is currently generating landfill gas.

It is our understanding that a proposed use of the Facility is for residential purposes, and the potential purchaser would require that attainment of one (1) or a combination of the three (3) cleanup standards that are promulgated in Act 2 be demonstrated. Converse contacted Mr. Ted Loy, Director of Special Projects, PADEP Northcentral Region on September 22, 2005 to ask if Act 2 permits the use of property for residential purposes where the RMSC SHS has not been demonstrated and where landfill wastes are present. Mr. Loy stated in a subsequent telephone conversation of October 18, 2005 that he had discussed the issue with senior staff at the PADEP Northcentral Office and the PADEP Central Office, and PADEP has provided relief of liability for non-media solids (waste material) and affected media (soil and water) where attainment of an Act 2 standard has been adequately demonstrated. Mr. Loy strongly recommended that parties interested in developing landfills for residential purposes meet with PADEP as early in the Act 2 process as possible to discuss the process and issues.

The Phase II ESA data are not sufficient to demonstrate attainment of an Act 2 standard. The data indicate that mitigation of landfill gas would be necessary for the

development of the Facility. In addition, the *1991 Geotechnical Investigation Report* indicates that certain geotechnical issues would need to be addressed as part of the development of the Facility. If site development activities require the excavation of soil or waste materials from the Facility, the PADEP Document Number 258-2182-773: Management of Fill Policy - April 2004 Revision (*2004 Fill Policy*) provides guidance for identifying whether the material can be used as clean fill or if restrictions on use of the material apply.

### **LIMITATIONS**

The services that were provided by Converse were based solely on the investigation that is described in this Report Client acknowledged and agreed that:

1. It is unreasonable to expect Converse to be able to completely evaluate subsurface conditions, even after the most comprehensive exploratory program reasonably possible.
2. Site conditions change frequently due to the passage of time, human activities, and climatic conditions and uncertainties are therefore inherent in the nature of the services that are provided by Converse and impossible to avoid.
3. The identification of environmental conditions and the prediction of future or concealed conditions is an inexact scientific endeavor.
4. Anything herein to the contrary notwithstanding, Converse shall not be alleged to be negligent, nor shall Converse be liable under this Agreement or otherwise for occurrences occasioned by the performance of its Services in accordance with standards of care and diligence utilized by those performing similar services at the time and in the general vicinity in which the Services are performed.
5. This Agreement contains specific Liability Limitations.

Thank you for allowing Converse to perform our services. Should you have any questions or comments, please feel free to contact us.

Respectfully submitted,

**CONVERSE CONSULTANTS**

TWD = Total Well Depth in feet below grade.

SI = Screened Interval in feet below grade.

TOCG = Top of Well Casing relative to Grade.

+ = Approximate feet above grade.

- = Approximate feet below grade.

TOC = Top of Well Casing

DTW = Measured Depth to Groundwater from TOC.

GW ELEV = Calculated Groundwater Elevation.

NI = Well Not Installed at time of measurement.

NM = Well Not Measured.

NC = Not Calculated.

NSD = No Survey Data.

IA = Inaccessible.

EM = Equipment Malfunction.

SNR = Survey data not yet available.

## Data Qualifiers

Please Note: If a number appears next to a result, it corresponds (in order) to the qualifiers listed below, starting with [1].

## Report Definitions

<	Denotes Less Than (symbol)
Laboratory Reporting Limit	The lowest reporting limit Fairway Laboratories will report based on a statistical 99% Confidence interval.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

## Semivolatile Organic Compounds by EPA Method 8270C

Hexachlorobutadiene	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
Hexachlorocyclopentadiene	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
Hexachloroethane	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
Phenanthrene (1,2,3-cd) pyrene	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
Isophorone	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
2-Methylnaphthalene	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
2-Methylphenol	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
2-Nitroaniline	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
3-Nitroaniline	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
4-Nitroaniline	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
Nitrobenzene	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
2-Nitrophenol	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
4-Nitrophenol	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
N-Nitrosodi-n-propylamine	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
Pentachlorophenol	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
Phenanthrene	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
Phenol	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
Pyrene	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
1,2,4-Trichlorobenzene	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
2,4,5-Trichlorophenol	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg
2,4,6-Trichlorophenol	<10.0	10.0	ug/l	09/09/05 05:40	EPA 8270C	bg

## Data Qualifiers

Please Note: If a number appears next to a result, it corresponds (in order) to the qualifiers listed below, starting with [1].

## Report Definitions

<	Denotes Less Than (symbol)
Laboratory Reporting Limit	The lowest reporting limit Fairway Laboratories will report based on a statistical 99% Confidence interval.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
